The American Association of Immunologists (AAI), the world’s largest professional society of research scientists and physicians who study the immune system, respectfully submits this testimony regarding fiscal year (FY) 2016 appropriations for the National Institutes of Health (NIH). AAI recommends an appropriation of at least $32 billion for NIH for FY 2016 to fund important ongoing research, strengthen the biomedical research enterprise, and ensure that the most talented scientists, trainees, and students are able to pursue careers in biomedical research in the United States.

NIH’s Essential Role in Advancing Biomedical Research

As the nation’s main funding agency for biomedical and behavioral research, NIH supports the work of “more than 300,000 researchers at more than 2,500 universities, medical schools, and other research institutions in every state and around the world.”¹ More than 80% of the NIH budget is awarded to these scientists through nearly 50,000 competitive grants; about 10% of the NIH budget supports the work of the almost 6,000 government researchers who work in NIH laboratories or at the NIH Clinical Center.² NIH funding is a vitally important economic engine in the communities and states where these researchers work; in FY 2012, NIH funded research supported an estimated 402,000 jobs across the United States."³ NIH also provides crucial scientific leadership to the entire biomedical research enterprise, both within and beyond our borders. Advancing basic research from bench to bedside requires extensive collaboration among scientists from academia, government,⁴ and industry; all depend on NIH personnel and policies to guide and facilitate their efforts in this enormous, complicated, and high-stakes endeavor. In fact, the biotechnology and pharmaceutical industries rely heavily on NIH’s investment in basic biomedical research; it is often this research that industry uses or further explores to develop new drugs and medical devices.⁵
Erosion of NIH Budget Slows Research and Threatens U.S. Preeminence

Although NIH funds most biomedical research in the United States, its purchasing power has been dramatically reduced by inadequate budgets that have been further eroded by inflation.\(^6\) In FY 2015, NIH’s purchasing power is 22% lower than it was in FY 2003.\(^7\) This reduced purchasing power enables NIH to fund only $\sim 16.8\%$ of grant applications submitted, a steep decline from the $\sim 32.4\%$ it funded when its budget was robust.\(^8\) This loss is not only a barrier to advancing crucially important research, it is also devastating to those who are currently engaged in - or considering - a career in biomedical research. Researchers around the country are closing labs and losing jobs; in some cases, they are moving overseas, where support for biomedical research is rapidly growing.\(^9\) Many who do stay in the U.S. are engaged in an unrelenting and time consuming search for funding, when they should be conducting research and mentoring the nation’s future researchers, doctors, inventors and innovators. Most importantly of all, we will never know what research has not been pursued - or how many potential treatments and cures have not been discovered - because of inadequate funding.

The Immune System: Essential to our Health, Crucial to our Future

As the body's primary defense against viruses, bacteria, and parasites, the immune system protects its host from a wide range of diseases and disorders. When it is operating properly, the immune system can provide powerful protection against many illnesses, including cancer, Alzheimer’s disease, and cardiovascular disease. When it underperforms, it can leave the body vulnerable to infections, such as influenza, HIV/AIDS, tuberculosis, malaria, and the common cold. The immune system can also become overactive and attack normal organs and tissues, causing autoimmune diseases including allergy, asthma, inflammatory bowel disease, lupus, multiple sclerosis, rheumatoid arthritis, and type 1 diabetes.

Immunologists are on the front lines, therefore, working to harness the immune system to protect people and animals from chronic and acute diseases and disorders, as well as from natural or man-made infectious organisms (including Ebola, plague, smallpox and anthrax) that could be used for bioterrorism.
Recent Immunological Advances: Providing Hope for Today - and Tomorrow

1. Cancer Immunotherapies: Real Results in the Fight Against Cancer

Lauded by *Science* magazine in 2013 as “The Science Breakthrough of the Year,” the genetic engineering of a cancer patient’s T cells (immune cells) to kill the patient’s own cancer cells, a procedure known as immunotherapy, continues to advance. At NIH funded medical centers, scientists and doctors are observing a significant regression of blood cancers (non-solid tumors) in both children and adults. This therapy, which the FDA granted Breakthrough Therapy designation in July 2014 (which can expedite approval of a therapeutic based on clear clinical efficacy), is poised to be used for even more difficult-to-treat solid tumor cancers, and is helping to inform ongoing clinical trials in breast, lung, prostate and brain cancer. The success of these therapies has also attracted the investment of pharmaceutical companies and has led to the development of several new T cell therapy-focused biotechnology companies, illustrating how investment in NIH funded research creates opportunity - and jobs - in the private sector.

2. Ebola Outbreak: Finding a Vaccine to Save Lives

The 2014 Ebola virus outbreak in West Africa, the largest in recorded history, spread rapidly due to a lack of public health infrastructure, prophylactics, and therapeutics. Like many such diseases which have historically low rates of infection, Ebola had not attracted commercial interest. However, ongoing research by federal agencies, including NIH, provided a sufficient foundation for the development of several vaccine candidates, two of which are now being administered through clinical trials in the outbreak region and showing promising results. Although pharmaceutical companies are now involved in manufacturing vaccines and other potential therapies, it is the federal investment in research that has made possible a rapid response to this urgent health crisis. Because we do not know what infectious disease might emerge next, it is crucial that the federal government continue to fund basic biomedical research to ensure our ability to respond quickly, particularly when the public health benefit outweighs the potential commercial benefit.

3. A New Way to Stop HIV … and Other Infections and Diseases?
Researchers have recently discovered that Clustered Regularly Interspaced Short Palindromic Repeats (CRISPR) systems - immune mechanisms used by bacteria to defend themselves from virus infection - present a novel therapeutic tool for immunologists, enabling them to successfully disrupt HIV replication, stop the growth of human cervical cancer cells and kill antibiotic-resistant bacteria. Immunologists are also exploring the use of CRISPR to repair defective genes in stem cells, which may treat individuals with diseases like sickle cell anemia and immune deficiencies.

4. New Therapeutic Provides Real Hope for Autoimmune Treatment

In January 2015, the FDA approved the first of a new and highly effective class of treatments for psoriasis, a serious autoimmune skin disease. The new treatment inhibits IL-17 signaling, a process which initiates inflammation and which was first discovered by NIH funded researchers in 2005. This treatment has proven effective in Phase II clinical trials, with more than 70% of psoriasis patients showing over 75% clearance of disease, and nearly half showing 100% clearance of disease. Clinical trials targeting similar aspects of this pathway are yielding promising results and may offer hope to those suffering from other autoimmune diseases, including ankylosing spondylitis and rheumatoid arthritis.

Conclusion

AAI appreciates the subcommittee’s strong support for NIH and for ensuring a robust biomedical research enterprise in the United States, and recommends an appropriation of at least $32 billion for NIH in FY 2016.

1 http://www.nih.gov/about/budget.htm. NIH funds also support the work of non-scientist technical personnel.

2 Ibid.

4 AAI strongly opposes a federal policy that limits government scientists’ ability to attend privately sponsored scientific meetings and conferences (http://www.hhs.gov/travel/travelpolicy/2012_policy_manual.pdf) and believes that “the rules have… made government scientists feel cut off from the rest of the scientific community, wreaked havoc with their ability to fulfill professional commitments, and undermined the morale of some of the government’s finest minds.” Testimony (Amended) of Lauren G. Gross, J.D., on behalf of The American Association of Immunologists (AAI), Submitted to the Senate Homeland Security and Governmental Affairs Committee for the Hearing Record of January 14, 2014: “Examining Conference and Travel Spending Across the Federal Government” (http://aai.org/Public_Affairs/Docs/2014/AAI_Testimony_to_Senate_HSGAC_01142014.pdf).
“[NIH] … annual research funding… is the most important source of discoveries in the health sciences that ultimately leads to the development of important new therapeutics ….” Statement of Roger Perlmutter, Ph.D., Executive Vice President, Research & Development, Amgen, June 15, 2005 http://www.rdmag.com/articles/2005/06/managing-rapid-biotech-growth.

8 Research Project Grant Award Rate (“the likelihood of an individual application submission getting funded”). Rockey, Sally, “Comparing Success Rates, Award Rates, and Funding Rates,” Rock Talk, March 5, 2014. RPG success rates (“the number of awards made divided by the sum of the applications reviewed that fiscal year where revisions submitted in the same fiscal year are collapsed and counted as one application”) have also decreased drastically, from 32.4% to 18.1%. See http://nexus.od.nih.gov/all/2014/03/05/comparing-success-award-funding-rates/.
